

### New Location

After more than two years of searching, planning, preparation and refurbishing, EPI is now located in a new facility in Traverse City, Michigan. Just minutes from the Cherry Capital Airport (TVC) and other strategic shipping terminals, EPI now has new capabilities for the fabrication and timely delivery of all types of geomembrane liners. Our mailing address and phone number may have changed but NOT our commitment to quality!

## The Liner Letter - New Look

The Liner Letter was launched on October 17, 2001. The original pdf format served us well for many years. Along with our move to our new building we are moving to a new email format for our newsletter. Our goal is providing you with current, accurate information on EPI's activities and developments in geomembrane fabrication and installation.

There are many interactive hot links in this Liner Letter to direct you to more information about geomembranes and the activities of EPI. Please share your comments with us.

## Expanded Capabilities

EPI's new location in Traverse City is on the south west corner of LaFranier Rd. and South Airport Rd. This close to 90,000 square foot facility will provide us with the needed space to expand our capabilities for providing you with the finest geomembranes available.

Front Entrance of EPI

Our new, expanded quality control lab will provide constant feed back to all our production operations. The updated glass enclosed lab is located in the very center of our production area and will be the core of all geomembrane welding activities.

## This is NOT a drill...

A company's safety program is only as good as its implementation. On October 18, 2013 EPI's safety training faced the ultimate test: Cardiac Arrest. A vendor working on the refurbishing of EPI's new building suffered complete cardiac failure while working outside near the street in front of the building. Over the 2-way radio employees heard Mark Wolschon say, "This is NOT a drill. CALL 911. We need an ambulance NOW!" The call was made without hesitation. Within minutes, an off duty ER nurse stopped to help. About five minutes later a sheriff's deputy arrived with a defibrillator. Quick response before the ambulance arrived helped save a life! The patient is alive, well, and back at work thanks in part to hours of valuable safety training and practical practice by EPI employees.

Mark Wolschon  
QC Manager
